Week 6 Q3

1) What are the advantages of Templates

Templates can be beneficial because they allow a programmer to reuse an existing function or class.

2) What is the main problem with Templates

The main disadvantage to using templates are that they can cause some issues in existing code, such as no longer recognizing classes, etc, and they do not support many data types.

3) What are a few uses of the 'static' statement.

A static statement allows a class to create only a single static function. If a variable is declared static, it won't be replicated by any new objects.
