Week 14 Prog 5

How is polymorphism like a switch statement?

Polymorphism is similar to a switch statement in the sense that both allow you to manipulate a common function/input. Polymorphism allows you to override a common function in order to fit the needs of that class, while still inheriting the properties of that function. The switch statement allows you to output several cases for a common input. In short - both polymorphism and switches allow you to modify code based on a common base.
